# Levels of care

<table>
<thead>
<tr>
<th>Level 0</th>
<th>Patients whose needs can be met through normal ward care in an acute hospital</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Level 1</strong></td>
<td>Patients at risk of their condition deteriorating, or those recently relocated from higher levels of care, whose needs can be met on an acute ward with additional advice and support from the Critical Care team</td>
</tr>
<tr>
<td><strong>Level 2</strong></td>
<td>Patients requiring more detailed observation or intervention including support for a single failing organ system or post-operative care and those ‘stepping down’ from higher levels of care</td>
</tr>
<tr>
<td><strong>Level 3</strong></td>
<td>Patients requiring advanced respiratory support alone, or basic respiratory support together with support of at least two organ systems. This level includes all complex patients requiring support for multi-organ failure.</td>
</tr>
</tbody>
</table>

<table>

<tbody>
<tr>
<td><strong>Level 0: normal ward care</strong></td>
<td>Care of low risk mother</td>
</tr>
</tbody>
</table>
| **Level 1: Additional monitoring or intervention, or step down from higher level of care** | » Risk of haemorrhage  
» Oxytocin infusion  
» Mild pre-eclampsia on oral anti-hypertensives/fluid restriction etc  
» Woman with medical condition such as congenital heart disease, diabetic on insulin infusion |
| **Level 2: single organ support** | **Basic Respiratory Support (BRS)**  
» 50% or more oxygen via face-mask to maintain oxygen saturation  
» Continuous Positive Airway Pressure (CPAP), Bi-Level Positive Airway Pressure (BIPAP)  

**Basic Cardiovascular Support (BCVS)**  
» Intravenous anti-hypertensives, to control blood pressure in pre-eclampsia  
» Arterial line used for pressure monitoring or sampling  
» CVP line used for fluid management and CVP monitoring to guide therapy  

**Advanced Cardiovascular Support (ACVS)**  
» Simultaneous use of at least two intravenous, anti-arrythmic/anti-hypertensive/vasoactive drugs, one of which must be a vasoactive drug  
» Need to measure and treat cardiac output  

**Neurological Support**  
» Magnesium infusion to control seizures (not prophylaxis)  
» Intracranial pressure monitoring  
» Hepatic support  
» Management of acute fulminant hepatic failure, e.g. from HELLP syndrome or acute fatty liver, such that transplantation is being considered |
| **Level 3: advanced respiratory support alone, or support of two or more organ systems above** | **Advanced Respiratory Support**  
» Invasive mechanical ventilation  

**Support of two or more organ systems**  
» Renal support and BRS  
» BRS/BCVS and an additional organ supported* |

*a BRS and BCVS occurring simultaneously during the episode count as a single organ support*
Why caring for sick women matters

• 2.4 critical care admissions per 1000 maternities (ICNARC 2013)

• 17% antenatal
  – Respiratory failure most common
  – 91.3% of pregnant women admitted for non-obstetric reason

• 83% recently pregnant
  – MoH most common
  – 69.7% of recently pregnant women admitted for obstetric reason
Why caring for sick women matters

• Serious morbidity reported in 7.3 women per 1000 maternities (NHS Quality Improvement Scotland, 2010)

• Approximately 5% of all women require higher level care in our maternity units

• Wide variation in maternity services
  – Staff experience & skill
  – Equipment
  – Access & Proximity to (specialist) critical care
Why caring for sick women matters

• Challenges in the NHS
  – Timely access to care
  – Fragmented communication
  – Availability of critical care beds

• Increasing complexity
  – Obesity
  – Maternal age
  – Pre-existing health conditions
Maternal Mortality in the UK

- 2010-12: 10 per 100,000 maternities
- 2011-13: 9 per 100,000 maternities
- 2012-14: 8.8 per 100,000 maternities
- 2013-15: 8.5 per 100,000 maternities
- 2014-16: 9.8 per 100,000 maternities
The women who died 2014-16

In 2014-16 **9.8 women** per 100,000 died during pregnancy or up to six weeks after childbirth or the end of pregnancy.

Most women who died had multiple health problems or other vulnerabilities.
240 women died in 2013-5

For every woman who dies at least 9 have severe morbidity

2016 report (2012-2014 cases) features lessons for critical care

The survival rate amongst pregnant and postpartum women admitted to general critical care units is high (>98%) (ICNARC 2013) amongst the women who die, many receive a very high standard of care.
The women who died:
UK 2014-16

- 259 women died during pregnancy or up to 42 days postpartum
- 34 women’s deaths were classified as coincidental
- Thus there were a total of 225 women who died among 2,301,628 women giving birth
  - 9.78 deaths per 100,000 women giving birth
  - 1 in every 10,200 women giving birth
Causes of maternal death 2014-16

In 2014-16 9.8 women per 100,000 died during pregnancy or up to six weeks after childbirth or the end of pregnancy. Most women who died had multiple health problems or other vulnerabilities.

The diagram shows the rate of maternal deaths per 100,000 maternities by cause:

- Cardiac disease: highest rate
- Thrombosis & thromboembolism
- Other indirect
- Neurological
- Psychiatric
- Sepsis
- Haemorrhage
- Amniotic fluid embolism
- Malignancies
- Pre-eclampsia
- Early pregnancy deaths
- Anaesthesia

MBRRACE-UK Mothers and Babies: Reducing Risk through Better Care
Key messages - 1

- There has been no decrease in the overall maternal death rate in the UK.
- Most women who died had multiple health problems or other vulnerabilities.
- Substantial inequalities in maternal mortality rates:
  - Black women
  - Asian women
  - Older women
  - Women from deprived areas

<table>
<thead>
<tr>
<th>Demographic</th>
<th>Risk of Dying</th>
</tr>
</thead>
<tbody>
<tr>
<td>White women</td>
<td>8/100,000</td>
</tr>
<tr>
<td>Asian women</td>
<td>15/100,000</td>
</tr>
<tr>
<td>Black women</td>
<td>40/100,000</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Age Group</th>
<th>Risk of Dying</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aged 20-24</td>
<td>7/100,000</td>
</tr>
<tr>
<td>Aged 35-39</td>
<td>14/100,000</td>
</tr>
<tr>
<td>Aged 40 or over</td>
<td>22/100,000</td>
</tr>
</tbody>
</table>

In deprived areas, women are at greater risk of dying:
- Least deprived: 3/100,000
- Most deprived: 11/100,000
Key messages - 2

• Thromboembolism and cardiac disease remain the leading causes of death up to six weeks after the end of pregnancy.
• Cancer and suicide are the leading causes of women’s deaths from six weeks up to one year after pregnancy.
• There have been welcome developments in plans for services for women with co-existing physical and mental health problems.
• Improvements in care were noted in a high proportion of women who survived after severe haemorrhage.
Balancing choices:
Always consider individual benefits and risks when making decisions about pregnancy.

Things to think about:

<table>
<thead>
<tr>
<th>Event</th>
<th>White women</th>
<th>Asian women</th>
<th>Black women</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dying in pregnancy</td>
<td>8/100,000</td>
<td>15/100,000</td>
<td>40/100,000</td>
</tr>
</tbody>
</table>

Black and Asian women have a higher risk of dying in pregnancy.

<table>
<thead>
<tr>
<th>Age</th>
<th>White women</th>
<th>Asian women</th>
<th>Black women</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aged 20-24</td>
<td>7/100,000</td>
<td>14/100,000</td>
<td>22/100,000</td>
</tr>
</tbody>
</table>

Older women are at greater risk of dying.

Be body aware - some symptoms are normal in pregnancy but know the red flags and always seek specialist advice if symptoms persist.

Overweight or obese women are at higher risk of blood clots including in early pregnancy.

Many medicines are safe during pregnancy.

Continuing medication or preventing illness with vaccination may be the best way to keep both mother and baby healthy - ask a specialist.
Key messages from previous MBRRACE Reports

• Early recognition of critical illness, prompt involvement of senior clinical staff and authentic multi-disciplinary team working remain the key factors in providing high quality care to sick pregnant and postpartum women.

• Reduced or altered conscious level is not an early warning sign; it is a red flag which indicates established illness.

• Key investigations must not be delayed because of pregnancy.
Key messages from MBRRACE 2016

• Inter-hospital referral of a sick pregnant or postpartum woman should be directed by the principle ‘one transfer to definitive care’. It is unlikely to be appropriate to move a sick antenatal woman to a facility without on-site obstetric cover.

• Severe respiratory failure in pregnant and postpartum women should trigger early referral to an ECMO centre.

• Obstetricians and obstetric anaesthetists must remain closely involved in the clinical management of women with obstetric specific conditions such as pre-eclampsia. These conditions are rarely seen on the general critical care unit but are common problems on the labour ward.
Key messages from MBRRACE 2016

• Pregnancy can make the differential diagnoses of critical illness more complex. There must be a balance between appropriate clinical suspicion and a conclusive diagnosis; not all hypertension is pre-eclampsia and shortness of breath is not always a pulmonary embolism.
Key messages from MBRRACE 2016/7

• Critical care support can be initiated in a variety of settings. Critical care outreach nurses can work in partnership with midwives to provide care before transfer to the critical care unit. Delay caused by bed pressures in a critical care unit is not a reason to postpone the delivery of critical care.
New national guidance

Intrapartum care for women with existing medical conditions or obstetric complications and their babies

NICE guideline [NG121]  Published date: March 2019

Guidance

Recommendations
Recommendations for research
Rationale and impact
Context
Finding more information and resources

This guideline covers care during labour and birth for women who need extra support because they have a medical condition or complications in their current or previous pregnancy. The guideline also covers women who have had no antenatal care. It aims to improve experiences and outcomes for women and their babies.

NICE has also produced a guideline on care during labour and birth for healthy women and their babies.

Recommendations
This guideline includes recommendations on:
- heart disease, bleeding disorders and subarachnoid haemorrhage
Acute care toolkit 15
Managing acute medical problems in pregnancy Oct 2019

Over two-thirds of all maternal deaths in the UK are due to non-obstetric, medical problems in pregnancy and postpartum. This may be linked with increasing maternal age and obesity. This toolkit provides practical guidance on managing women with acute medical problems in pregnancy for hospital physicians and others who may be unfamiliar with the normal physiology of pregnancy and/or diseases that present in pregnancy.

Who should read this toolkit?

This toolkit is intended to be used widely, including by front-line NHS healthcare professionals and those involved in local and national planning and policy.

Summary of key recommendations/standards
Women’s experiences

- Common feelings
  - Fear,
  - Frustration,
  - Disempowerment
  - Shock during the immediate emergency,
  - Symptoms of anxiety,
  - Alienation and
  - Flashbacks in the aftermath.

- Clara had a haemorrhage and hysterectomy after giving birth to her first child. She did not appreciate how ill she had been until her mother brought in a photo of her newborn and stuck it on the end of the bed.

  ‘I remember looking at this picture, and going, it’s the sort of thing people do to help you pull through...And I sort of went, this isn’t good, is it? I’m genuinely really sick? And that sort of brought it home.’ (Clara)
Why caring for sick women matters

**Care in a maternity setting**

**Pros**

- Support from critical care outreach team
- Avoid transfer for the woman
- Baby nearby
- Support with breast feeding
- Understanding of pregnancy and birth experience

**Cons**

- Can be harder to ensure review by all specialities
- Focus on obstetric complications
- Reliant on maternity staff having necessary skills and resources

</tbody>
</table>
Impact of significant illness

- Vulnerable to further complications e.g. VTE
- Loss of muscle tone
- Fatigue
- Gaps in memory and the story
- Impact on bonding
- Longer hospital stay
- Delayed recovery
- Impact on partner and family
- Reframe expectations of birth and early motherhood
- PTSD, postnatal anxiety or depression
- Consequences for future pregnancy
What does this all mean?

Women get sick

Safe effective care

Midwives key role

Team approach

CPD for midwifery practice
